Android Solutions Architect and former Android Developer with experience building and optimizing mobile applications in Kotlin and Java. Skilled at diagnosing critical performance issues (ANR, memory, rendering), leading development teams through complex integrations, and introducing modern architectural patterns. Combines deep technical debugging with mentorship and spec-driven development to deliver reliable, scalable apps.

Work Experience

Android Solutions Architect

Forty Degrees Celsius Inc.

2024 - Present

- Led technical direction for Android projects, owning architecture decisions that balanced scalability, security, and integration constraints.
- Conducted feasibility assessments for new feature requests, identifying risks early and proposing alternative approaches that saved development time.
- Mentored junior developers through regular code reviews and architecture consultations, raising team code quality and consistency.
- Proactively reviewed pull requests for architectural alignment and performance, catching bottlenecks such as unnecessary recompositions and excessive object allocations, directly improving scroll performance and memory usage.
- Served as the primary bridge between upper management and the development team, translating business goals into clear technical requirements and ensuring on-time delivery.
- Introduced and enforced coding standards, static analysis rules (Detekt), and PR review practices that reduced post-release crash reports, demonstrating a measurable improvement in code quality and product stability.

Android Developer

Forty Degrees Celsius Inc.

2018 - 2024

- Resolved a critical ANR (Application Not Responding) in production by identifying root cause in threading mismanagement, restoring smooth UX and reducing user complaints.
- Debugged and fixed a complex integration-phase bug in collaboration with a teammate, unblocking a milestone delivery.
- Maintained and enhanced app features in Java and Kotlin, migrating legacy components to Kotlin and implementing Coroutines/Flow for reactive data handling, resulting in improved efficiency and codebase modernization.
- Utilized Firebase Crashlytics to triage and resolve high-priority user-reported bugs, consistently closing tickets within SLA.
- Assessed and integrated third-party libraries and REST APIs, ensuring optimal performance and security while supporting streamlined project delivery.

Education

University of Cebu

Bachelor of Science in Information Technology

Skills

Hard Skills

Kotlin, Java, JavaScript (basic), Android SDK, Jetpack Compose (actively learning), Coroutines, Flow, MVVM, ViewModel, LiveData, Clean Architecture, multi-module apps, SOLID principles, spec-driven development, Git, GitHub, GitHub Actions, Gradle, Detekt, Firebase

Crashlytics, REST APIs, Socket programming, Skyway WebRTC, MCP integration, AI-assisted development, threading management, unit testing (JUnit, Mockito – basic)

Soft Skills

Code reviews, performance optimization (ANR debugging, UI jank fixes), technical mentoring, feasibility analysis, technology evaluation

Projects

Native Camp – English Online (Android app)

A real-time English tutoring platform with messaging, video, and scheduling for Japanese learners.

- Built chat and session scheduling modules using Kotlin, Coroutines, and Socket.IO.
- Integrated Skyway WebRTC for real-time video/audio communication, ensuring low-latency interactions.
- Refactored legacy Java components to Kotlin, improving test coverage and maintainability.
- Collaborated with backend team to design REST APIs consumed by the app.

Mache LIVE (Android app)

A live-streaming application supporting real-time video broadcast and interactive audience chat. Developed using Kotlin with custom media player integration; contributed to performance tuning of video playback and UI responsiveness.

MacheTV (Android app)

An interactive TV platform delivering on-demand and live content; assisted in feature development and bug fixing, ensuring stable playback and seamless user experience across multiple device types.
